

SQL Inventory Manager

DISCOVER, TRACK, AND MANAGE YOUR SQL SERVER INVENTORY

SQL Inventory Manager provides fundamental information on your SQL Server assets to help you track, report on, and manage your database environment from a web-based dashboard. It gives a broad enterprise-wide view with actionable information for all SQL Server inventory through automated discovery, inventory/asset management, and environment health checks. View core information such as how many databases exist, where they reside, how they are configured and more so you can stay organized and better manage the server inventory as the organization grows.

WHY SQL INVENTORY MANAGER?

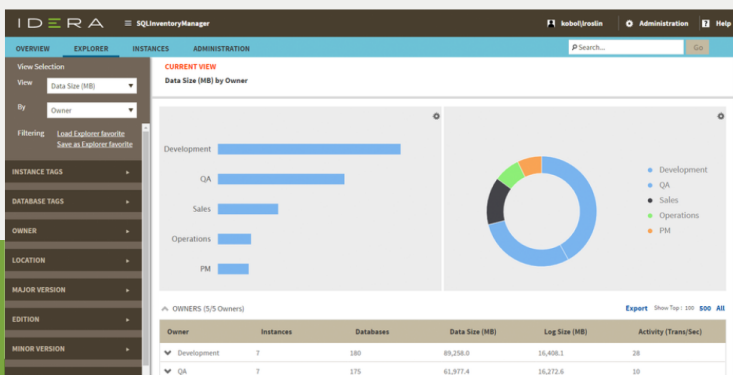

As an administrator of SQL Servers, you need a simple, efficient way to discover, document, and manage your SQL Server environment as the organization grows. Perhaps you have a proliferation of SQL Servers coming online which may have been added without your knowledge and are difficult to track in spreadsheets. Maybe you are the new administrator to your organization and just need a level set of your SQL Server inventory from which to start.

Perhaps you have a general idea of how many SQL Servers are in your environment, but you are not sure which ones are the biggest or the busiest, whether they are up to date with the latest patches, which are backed up or how they are being utilized. Another scenario might be that you have multiple IT-related responsibilities and have inherited SQL Servers to your charter so you are looking to know the basics in order to manage them effectively. For any of these scenarios, it's important to have a way to inventory your environment and determine which SQL Servers need oversight and maintenance.

SQL Inventory Manager offers an organized web-based dashboard that captures core information about the entire inventory of SQL Servers across the environment.

PRODUCT HIGHLIGHTS

- View SQL Server inventory to know what you have where and who owns it
- Auto-discover new servers to better manage server sprawl
- Perform health checks to monitor server operation and capacity
- Get alerts when a server goes down or space is running low
- Create tags and custom fields to organize servers and databases across the enterprise
- Collect and manage server environment details with the web-based agentless UI

Start for FREE!

SQL Inventory Manager is a very valuable tool for starting DBAs or IT groups that have no clue what they have in their network.

INVENTORY MANAGEMENT

Views and Topology The Dashboard view provides high-level visibility of all inventory. Filter down on individual servers and databases to get insights on what they are being used for and what resources are being utilized, and easily export the list to PDF, Excel, or XML format if desired. See detailed information on a SQL instance such as SQL Server version, memory, number of databases, data size or log size. Create custom inventory fields or labels at the server, instance or database level for further categorization.

Tags and Annotation Create tags to organize SQL Servers by owner, location, function or other categories to suit different needs. You can also set tags at the instance and database level for further filtering and exploration. Drill down to see more details on the most common groups in your environment.

Graphical Inventory Explorer The graphical Explorer displays the different server and database groups from the tags created into a visual pie chart. Compare, filter and navigate across different groups to better understand your whole environment. Slice and dice the filters to get a better sense of the inventory you have, who owns the servers or databases and where they reside.

SQL Server License Tracking View a list of SQL Servers Builds, Versions, and Editions to ensure adherence to Microsoft licensing compliance. See all SQL Servers, which versions they are running, the number of instances they host and how many CPUs and cores they contain. You can also export this list or create a report, and give the information to your internal licensing team to take action for upgrade or consolidation as needed.

Server and Database Decommissioning Mark any instances and databases taken offline to a Decommissioned list to prevent erroneous alerting. Those servers will preserve asset and tagging information to view the data and in the event you need to re-commission later.

DISCOVERY & MONITORING

Server Discovery Methods Specify the discovery methods you wish to use to scan the network for servers and SQL instances via domains, IP address ranges, both standard and custom TCP ports &/or imported server lists from excel or CSV files. Discovery collection criteria are like that of Microsoft's Assessment and Planning (MAP) toolkit including SQL Server Resolution Service, WMI, TCP Probe, Service Control Manager and Windows Registry.

Monitor Everything Monitor and manage thousands of databases across the spectrum of SQL editions including SQL Server 2000, 2005, 2008, 2008R2, 2012, 2014, 2016, 2017 and SQL Express. You can also monitor database instances on AlwaysOn Availability Groups and add instances from the cloud on both IaaS for Amazon RDS and SQL Azure.

Schedule Auto-scans Run recurring automatic scans to find newly added servers which you did not know about. Flexible scheduling options are available for both browser service and computer scans which can be set to recur daily or on particular days of the week including time of day. Set defaults to automatically register all newly added instances discovered for immediate monitoring or set filters for particular SQL Server editions.

Expedite Discovery Specify a series of alternate login credentials with appropriate privileges to use during the discovery process in case the original credentials are not valid to expedite the discovery process and remove limitations of domain admin credential only.

ENTERPRISE MANAGEMENT

Web-based, Agentless, Low Impact Design Download, install and use SQL Inventory Manager in under 5 minutes. As a stand-alone web application, there is no need for IIS and users can sign on and use it remotely from anywhere. Discover servers automatically with no other modules, plug-ins or professional services needed to get started. SQL Inventory Manager is agent-less so there is no need to install anything on monitored servers.

Scalable for Future Growth SQL Inventory Manager is designed to support the entire SQL environment with thousands of monitored databases. Users can discover and manage Development, QA, Production and even SQL Express instances and manually add or remove instances and databases on the fly as needed. There is no need to know exactly how many SQL Servers you have, simply buy by groups of servers and move up to the next band group as your environment grows.

Integration with IDERA Dashboard Access a consolidated dashboard console to quickly view and navigate between SQL Inventory Manager and the other products you may use from IDERA. SQL Inventory Manager will show key indicators in the dashboard view including Top Databases by Size, Top Databases by Activity, Tags Cloud, and SQL Server Licensing Info.

Reporting Utilize a pre-defined set of server inventory reports grouped and sorted for different purposes, such as OS patch version or application usage. View inventory reports grouped by server attributes and annotations and export and print as needed. Generate customizable reports to compile information about the SQL Server environment, including SQL licensing, inventory summary, chargebacks, and health checks.

Role-based Security Specify different levels of user access including administrator, modify only and read-only. View a list of users and security profiles at the database and instance levels to determine the types of users that have privileges. Plus establish a series of either domain-only permissions or a list of alternate login credentials with appropriate privileges to use during the discovery process to limit exposure to unauthorized users.

ALERTING & HEALTH CHECKS

Top Alerts Alert notifications are generated automatically and sent via email. Indicators for alerts include SQL Server or database down, database at risk of becoming full, and more.

Health Checks View daily health checks of the server environment to gauge adherence to best practices. If a SQL Server is operating with poor configuration practices, see a list of detailed results with actionable recommendations for improvement from SQL Server experts in easy to understand language.

Help Tips Built-in Tips are provided, which are context sensitive, to assist in interpreting the information exposed and remove any guesswork. Explanations provided are free of "jargon" so you don't have to be an expert to interpret what to do next to speed up server management tasks.
